- planning and development of digitalization of business processes related to sales and warehouse organization
- optimization and integration of e-commerce platform
- development of company tools for workload optimization
- maintenance of company servers/network

SKILLS

As a full stack developer, I have acquired a wide range of technical skills that allow me to manage the entire development cycle of a project, from back-end to front-end. Throughout my career, I have developed solid skills in programming languages such as JavaScript, PHP and ASP.net, and have worked with frameworks and libraries such as Laravel, Symfony, Vue, React, Node.js and jQuery. I also have a good knowledge of databases, particularly MySQL, MSSQL, MongoDB, and have experience in using version control tools such as Git.

I have designed several front-ends for website search using various technologies such as MySQL full text search, Meilisearch, and Elasticsearch.

I have experience in using Continuous Integration/Continuous Deployment (CI/CD) through Git and GitHub. I have created CI/CD pipelines to automate the code integration and deployment process.

I have gained experience in managing both Windows and Linux servers, using tools such as Plesk, cPanel, or command-line via ssh. I have successfully managed server configuration, software installation and maintenance, performance optimization, and system security. Additionally, I have implemented backup strategies to ensure client data security and business continuity. I have developed automated backup procedures and regularly tested data recovery to ensure reliable backup processes.

SKILLS

My experience in server management has provided me with a solid understanding of the challenges that can arise when managing a production system and has allowed me to develop the skills necessary to solve any issues promptly and efficiently.

In addition to technical skills, I also have excellent problem-solving, analytical, and communication skills, which allow me to collaborate effectively with other developers, designers, and stakeholders to ensure successful project delivery.
